

UPI Integration Guide - Synthetic Developer Reference

DOC-018 | Version 2.4 | Access: Developer

Integration model

The synthetic flow models payer app -> payer PSP/bank -> payment switch -> payee PSP/bank -> response/reconciliation. Participant terminology is based on public NPCI UPI material, while internal APIs and error behavior are fictional.

API behavior

Operation	Identifier	Success state	Retry
Create payment	clientRequestId	INITIATED	Reuse idempotency key
Poll status	transactionId	CONFIRMED/FAILED/PENDING	Safe to repeat
Resolve pending	transactionId	RECONCILED	Operations only
Raise dispute	transactionId	DISPUTE_CREATED	Support workflow

Response semantics

A switch response can arrive before ledger posting. Keep external-result state separate from accounting state. A pending response is not automatically a failure.

Security

Never ask customers to share a UPI PIN. Do not log secrets. Validate callback authenticity before accepting asynchronous results.

Public reference context

NPCI publicly describes UPI as an instant payment system and identifies participant roles such as payer PSP, remitter bank, payee PSP and beneficiary bank.
